How expected volatility was determined, including an explanation of the extent to which expected volatility was based on historical volatility: **The measure of volatility used in the Black-Scholes option-pricing model is the annualized standard deviation of the continuously compounded rates of return on the stock over a period of time. In respect of options granted during the year, we have considered the volatility for periods, corresponding to the respective expected lives of the different vests, prior to the grant date. We have considered the daily volatility of the Company's stock price on NSE over these years.**

**Besides key assumptions stated above, no other features of the options grant were considered relevant while measuring the fair value.**
